2102006

Question 1 :

Simulate Cyclic Redundancy Check (CRC) error detection algorithm for noisy channel.

Solution 1 :

```
/* Created By - ANAND KUMAR MISHRA */

#include <iostream>
#include <string>
using namespace std;

/* To remove leading spaces in a string */
string removeLeading0s(string str)
{
    int i;
    for (i = 0; i < str.length(); i++)
        if (str[i] == '1')
        {
            break;
        }
    return str.substr(i);
}
/* To check if each bit in string is zero */
bool isZero(string str)
{
    str = removeLeading0s(str);
    if (str.length() <= 0)
        return true;
    else
        return false;
}
/* To check if input string has any errors or illegal characters */
bool checkInput(string str)
{
    str = removeLeading0s(str);
    if (isZero(str))
    {
        cout << "\nInput Error!\nEntered bits are only zero.\n"
             << endl;
        return false;
    }
    for (int i = 0; i < str.length(); ++i)
    {
        if (str[i] != '1' && str[i] != '0')
```

```
        {
            cout << "\nInput Error!\nEntered bits contain characters other than 0
or 1.\n"
                 << endl;
            return false;
        }
    }
    return true;
}

string division(string dividend, string divisor)
{
    string remainder = "";
    for (int i = 0; i <= dividend.length() - divisor.length();)
    {
        /* Taking XOR, bit by bit */
        for (int j = 0; j < divisor.length(); ++j)
            dividend[i + j] = (dividend[i + j] == divisor[j]) ? '0' : '1';

        /* To find the index for next iter*/
        while (i < dividend.length() && dividend[i] != '1')
            ++i;
    }
    /*
        Calculating remainder i.e. last n-1 digits of encoded string, n: length of
gen
    */
    remainder = dividend.substr(dividend.length() - divisor.length());
    return remainder;
}

void CRC(string encoded, string gen)
{
    int i;
    /* Checking for error by again performing modulo 2 division */
    cout << "\nApplying Cyclic Redundancy Check...." << endl;
    string rem = division(encoded, gen);
    if (!isZero(rem))
        cout << "\nError detected!\nRemainder: " << removeLeading0s(rem);
    else
        cout << "\nNo error!\nRemainder is 0.";
}

int main()
{
    /* Creating Variables */
    int i;
```

```
    string msg, gen, rem, temp, encoded;

    cout << "\nEnter the frame: ";
    cin >> msg;
    if (!checkInput(msg))
        return 1;
    cout << "Enter the generator: ";
    cin >> gen;
    if (!checkInput(gen))
        return 1;
    if (gen[gen.length() - 1] != '1')
    {
        cout << "\nInput Error!\nLast bit in generator is not 1.\n"
             << endl;
        return 1;
    }
    if (msg.length() < gen.length())
    {
        cout << "\nInput Error!\nLength of frame is smaller than length of
generator.\n"
             << endl;
        return 1;
    }

    /* Cleaning input */
    msg = removeLeading0s(msg);
    gen = removeLeading0s(gen);

    // Appending zero bits to the low-order end of the message

    temp = msg;
    for (i = 0; i < gen.length() - 1; ++i)
        temp += "0";

    // Performing modulo 2 division to find remainder and printing it

    rem = division(temp, gen);
    cout << "\nRemainder: " << removeLeading0s(rem) << endl;

    /* Calculating encoded msg */
    encoded = msg + rem.substr(1);
    cout << "Transmitted frame: " << encoded << endl;

    /* Adding Error */
    char ch;
    cout << "\nWant to add errors ? (Y/N): ";
    cin >> ch;
```

```
    if (ch == 'y' || ch == 'Y')
    {
        int n;
        cout << "\nEnter the index of bit to add the error: ";
        cin >> n;
        encoded[n - 1] = (encoded[n - 1] == '0') ? '1' : '0';
        cout << "\nTransmitted frame with error: " << encoded << endl;

        /* Checking error by CRC */
        CRC(encoded, gen);
    }
    cout << endl;
    return 0;
}
```

Output 1 :

```
Enter the frame: 110101
Enter the generator: 101

Remainder: 11
Transmitted frame: 11010111

Want to add errors ? (Y/N): y

Enter the index of bit to add the error: 2

Transmitted frame with error: 10010111

Applying Cyclic Redundancy Check....

Error detected!
Remainder: 1
```

```
Enter the frame: 1101234

Input Error!
Entered bits contain characters other than 0 or 1.
```

```
Enter the frame: 1101011
Enter the generator: 0000

Input Error!
Entered bits are only zero.
```

```
Enter the frame: 101011
Enter the generator: 110011011

Input Error!
Length of frame is smaller than length of generator.
```

```
Enter the frame: 101011
Enter the generator: 10

Input Error!
Last bit in generator is not 1.
```

Question 2 :

Simulate Hamming code for a given input message.

Solution 2 :

```
/* Created By - ANAND KUMAR MISHRA */

#include <iostream>
using namespace std;

void hamming(int *data, int *redundant, int n, int r)
{
    int hammcode[n], count = 0, k = 0, r1 = r;
    for (int i = n; i >= 1; i--)
    {
        if (redundant[r1 - 1] != i)
        {
            hammcode[i] = data[k]; // initializing the hamming code with r bits=0
and data bits as given.
            ++k;
        }
        else
        {
            hammcode[i] = 0;
            --r1;
        }
    }
    for (int i = 0; i < r; i++)
    {
        for (int j = 1; j <= n; j++)
        {
            if ((1 << i) & j) // searching for numbers with (n+1)th bit position=1
            {
                if (hammcode[j] == 1)
                {
                    ++count; // for even parity.
                }
            }
        }
        if (count % 2 == 0) // if bit position=1,update the redundant bit position
according to even parity.
        {
            hammcode[redundant[i]] = 0;
        }
        else
```

```
        {
            hammcode[redundant[i]] = 1;
        }
        count = 0;
    }
    cout << "HAMMING CODE:";
    for (int i = n; i >= 1; i--)
    {
        cout << hammcode[i];
    }
}

int main()
{
    int size, a = 2, r = 1;
    cout << "Enter size of the data ::: ";
    cin >> size;
    while (1)
    {
        if (a >= (size + 1 + r)) // 2^r>=d+r+1
        {
            break;
        }
        ++r;
        a = a * 2;
    }
    int data[size];
    int redundant[5] = {1, 2, 4, 8, 16}, j = r;
    cout << "Enter data ::: " << endl;
    for (int i = 0; i < size; i++)
    {
        cout << "Bit " << i << " : ";
        cin >> data[i];
    }
    if (data[0] == 0)
    {
        cout << "Inappropriate data entered";
        exit(0);
    }
    hamming(data, redundant, size + r, r);
    return 0;
}
```

Output 2 :

```
Enter size of the data ::: 5
Enter data :::
Bit 0 : 1
Bit 1 : 0
Bit 2 : 1
Bit 3 : 1
Bit 4 : 1
HAMMING CODE:110110101
```

```
Enter size of the data ::: 4
Enter data :::
Bit 0 : 1
Bit 1 : 0
Bit 2 : 1
Bit 3 : 0
HAMMING CODE:1010010
```

```
Enter size of the data ::: 5
Enter data :::
Bit 0 : 0
Bit 1 : 1
Bit 2 : 0
Bit 3 : 1
Bit 4 : 1
Inappropriate data entered
```

Question 3 :

Simulate and implement stop and wait protocol for noisy channel.

Solution 3 :

```
/* Created By - ANAND KUMAR MISHRA */

#include <iostream>
#include <time.h>
#include <cstdlib>
#include <ctime>
#include <unistd.h>
#include <iomanip>
using namespace std;
class timer
{
private:
    unsigned long begTime;

public:
    void start()
    {
        begTime = clock();
    }
    unsigned long elapsedTime()
    {
        return ((unsigned long)clock() - begTime) / CLOCKS_PER_SEC;
    }
    bool isTimeout(unsigned long seconds)
    {
        return seconds >= elapsedTime();
    }
};
int main()
{
    int frames[] = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10};
    unsigned long seconds = 5;
    srand(time(NULL));
    timer t;
    cout << "Sender has to send frames : ";
    for (int i = 0; i < 10; i++)
        cout << frames[i] << " ";
    cout << endl;
    int count = 0;
```

```
    bool delay = false;
    cout << endl
         << "Sender\t\t\t\t\tReceiver" << endl;
    do
    {
        bool timeout = false;
        cout << "Sending Frame : " << frames[count];
        cout.flush();
        cout << "\t\t";
        t.start();
        if (rand() % 2)
        {
            int to = 24600 + rand() % (64000 - 24600) + 1;
            for (int i = 0; i < 64000; i++)
                for (int j = 0; j < to; j++)
                {
                }
        }
        if (t.elapsedTime() <= seconds)
        {
            cout << "Received Frame : " << frames[count] << " ";
            if (delay)

Do you want to continue (y/n) ::: n
```

Question 6 :

Simulate Classful Addressing by taking the IP address (Dotted-Decimal notation) as input and print the corresponding class.

Solution 6 :

```
/* Created By - ANAND KUMAR MISHRA */

// 6. Simulate Classful Addressing by taking the IP address (Dotted-Decimal
notation) as input and print the corresponding class.

#include <iostream>
#include <string>
using namespace std;

char findClass(string str)
{
    string arr;
    int i = 0;
    while (str[i] != '.')
    {
        arr = arr + str[i];
        i++;
    }
    int ip = stoi(str);

    if (ip >= 1 && ip <= 126)
    {
        return 'A';
    }
    else if (ip >= 128 && ip <= 191)
    {
        return 'B';
    }
    else if (ip >= 192 && ip <= 223)
    {
        return 'C';
    }
    else if (ip >= 224 && ip <= 239)
    {
        return 'D';
    }
    else if (ip >= 240 && ip <= 255)
    {
```

```
        return 'E';
    }
    else
    {
        return 'I';
    }
}

int main()
{
    string str;
    char ch = 'y';
    do
    {
        cout << "Enter IP : ";
        cin >> str;
        char ipClass = findClass(str);
        if (ipClass == 'I')
        {
            cout << "Invalid IP address" << endl;
        }
        else
        {
            cout << "Given IP address belongs to Class " << ipClass << endl;
        }

        cout << "Do you want to continue(y/n) : ";
        cin >> ch;

        if (ch != 'y')
        {
            break;
        }

    } while (ch == 'y');

    return 0;
}
```

Output 6 :

```
Enter IP : 121.1.15.12
Given IP address belongs to Class A
Do you want to continue(y/n) : y
Enter IP : 181.25.35.10
Given IP address belongs to Class B
Do you want to continue(y/n) : y
Enter IP : 201.2.2.0
Given IP address belongs to Class C
Do you want to continue(y/n) : y
Enter IP : 230.7.4.10
Given IP address belongs to Class D
Do you want to continue(y/n) : y
Enter IP : 251.9.9.9
Given IP address belongs to Class E
Do you want to continue(y/n) : y
Enter IP : 270.5.4.1
Invalid IP address
Do you want to continue(y/n) : n
```
